How it Works

TransparINT Monitor uses Machine Learning and Natural Language Processing to filter vast quantities of unstructured data from millions of sources to efficiently identify financial crime and reputational risk. TransparINT scores the relevance of each record. This approach provides vastly more negative news coverage, while limiting irrelevant results.

Once alert matches are identified, the system provides a fully integrated alert assignment and management dashboard that allows users to resolve alerts with complete audit tracking running in the background. A manager analytics dashboard provides insight into department work capacity, productivity, and alert trends.

Better Outcomes

- Actual Real-Time monitoring. Be alerted as new negative news is published.
- ✓ Search more sources than any other negative news application.
- ✓ Simple to use and under your control. Easy batch file upload.
- Investigate and resolve alerts directly in case management dashboard.
- Complete control over alert assignments, escalations, and dispositions.
- Full audit, analytics, and manager reporting capabilities.

TransparINT continues bringing innovation to AML, enabling users to immediately improve the quality of compliance and reduce wasteful inefficiency.
